The International Radio Regulations are developed by the:

- a United Nations
- b International Telecommunication Union
- c International Amateur Radio Union
- d International Standards Organisation

02-9

An application for the New Zealand General Amateur Operator Certificate of Competency and a callsign must be supported with an appropriate examination pass qualification and may be made by:

- a a citizen or a permanent resident of New Zealand, or others, after an approval from a referral to the RSM Licensing Manager
- b any visitor, but only after acquiring a New Zealand contact address
- c anyone except the representative of a foreign government
- d anyone except an employee of the MBIE

03-5

Persons in your family who are unqualified cannot transmit using your amateur station if they are alone with your equipment, because they must:

- a know the right frequencies and emissions required
- b hold a General Amateur Operator Certificate of Competency before they are allowed to be operators
- c not use your equipment without your express permission
- d know the correct abbreviations and the Q-code

04 - 4

Your amateur station is identified by transmitting your:

- a full name and address
- b "handle"
- c first name and location
- d callsign

05-7

A licence that authorises a given class of radio transmitter to be used without requiring a licence in the owner's own name is known as:

- a a general user radio licence
- b a reciprocal licence
- c a temporary licence
- d an interim licence

06-1

The Morse code signal "SOS" indicates that a station is:

- a in grave and imminent danger and requires immediate assistance
- b reporting a shipping hazard
- c about to send an important message for payment
- d about to go silent

07-1

- A New Zealand amateur radio operator may:
- a be prepared with emergency radio apparatus available on 12-hour notice
- b train for and support disaster relief activities
- c operate with emergency traffic-handling, using solar cells during week-end days
- d use portable antennas but, only during daylight hours

```
08-8
In New Zealand, the "70 centimetre band" frequency limits are:
   430 to 438 MHz
  430 to 450 MHz
  435 to 438 MHz
d 430 to 440 MHz
09-0
Operation on the 130 to 190 kHz band requires:
   a vertical half-wave dipole antenna
b special permission to operate in hours of darkness
   power output limited to a maximum of 5 watt e.i.r.p.
   receivers and computers with sound cards
The term describing opposition to electron flow in a circuit is:
  current
b voltage
c power
d resistance
This is a source of electrical energy:
a a p-channel FET
b an NiMH cell
c a carbon resistor
d a germanium diode
12-6
The unit for the potential difference between two points in a circuit is
the:
a
   ampere
b
   ohm
  volt
C
d
   coulomb
A current of 5 ampere in a 50 ohm resistance produces a potential
difference of:
  20 volt
b 45 volt
c 55 volt
d 250 volt
When an 8 ohm resistor is connected across a 12 volt supply, the current
flow is:
  8 / 12 amp
  12 - 8 amp
b
c 12 + 8 amp
d 12 / 8 amp
```

```
15-9
A dry cell has an open circuit voltage of 1.5 volt. When supplying a
large current, the voltage drops to 1.2 volt. This is due to the cell's:
   voltage capacity
b
    internal resistance
   electrolyte becoming dry
C
d
   current capacity
Five 10 ohm resistors connected in series give a total resistance of:
a 1 ohm
  5 ohm
b
   50 ohm
С
d
   10 ohm
17-1
Two resistors are in parallel. Resistor A carries twice the current of
resistor B, which means that:
   B has half the resistance of A
   A has half the resistance of B
    the voltage across A is twice that across B
C
d
    the voltage across B is twice that across B
A transmitter power amplifier requires 30 mA at 300 volt. The DC input
power is:
    300 watt
а
b 9000 watt
    6 watt
C
    9 watt
d
A resistor in a circuit becomes very hot and starts to burn. This is
because the resistor is dissipating too much:
  current
а
b voltage
c power
d resistance
20-9
A sinewave alternating current of 10 ampere peak has an rms value of:
    5 amp
b 14.14 amp
    7.07 amp
С
d
   20 amp
21-8
The reactance of an inductor increases as the:
    frequency decreases
    frequency increases
b
С
   applied voltage increases
    applied voltage decreases
```

Two 20 uH inductances are connected in series. The total inductance is:

- a 10 uH
- b 20 uH
- c 40 uH
- d 80 uH

23-3

A residual current device is recommended for protection in a mains power circuit because it:

- a reduces electrical interference from the circuit
- b removes power to the circuit when the current in the phase wire equals the current in the earth wire
- c removes power to the circuit when the phase and neutral currents are not equal
- d limits the power provided to the circuit

24 - 1

Zener diodes are normally used as:

- a RF detectors
- b AF detectors
- c voltage regulators
- d current regulators

25-4

A semiconductor device is described as a "general purpose audio NPN device". This is a:

- a triode
- b bipolar transistor
- c silicon diode
- d field effect transistor

26-9

A triode valve has this many grids:

- a one
- b two
- c three
- d three plus a filament

27-6

An ammeter should not be connected directly across the terminals of a 12 volt car battery because:

- a no current will flow because no other components are in the circuit
- b the resulting high current will probably destroy the ammeter
- c the battery voltage will be too low for a measurable current to flow
- d the battery voltage will be too high for a measurable current to flow

28-0

Assuming the same impedances, the input to an amplifier is 1 volt rms and the output 10 volt rms. This is an increase of:

- a 3 dB
- b 20 dB
- c 6 dB
- d 10 dB

In an HF station, the connection between the "antenna tuner" and the "antenna feed-point" could be made with:

- a 50 ohm coaxial cable
- b three-wire mains power cable
- c heavy hook-up wire
- d an iron-cored transformer

30-7

In a frequency modulation receiver, this is located between the limiter and the audio frequency amplifier:

- a the frequency discriminator
- b the intermediate frequency amplifier
- c the speaker and/or headphones
- d the high frequency oscillator

31-0

In a single sideband and CW receiver, the antenna is connected to the:

- a product detector
- b high frequency oscillator
- c intermediate frequency amplifier
- d radio frequency amplifier

32-9

The following transmission mode is usually demodulated by a product detector:

- a pulse modulation
- b single sideband suppressed carrier modulation
- c double sideband full carrier modulation
- d frequency modulation

33-5

The mixer stage of a superhet receiver:

- a produces an intermediate frequency signal
- b produces spurious signals
- c acts as a buffer stage
- d demodulates SSB signals

34-7

A double conversion receiver usually has:

- a a high-frequency IF stage followed by a much lower frequency IF stage
- b only one IF stage
- c poor image frequency rejection
- d two IF stages and a discriminator

35-5

The mixer stage of a superheterodyne receiver is used to:

- a change the frequency of the incoming signal to that of the IF
- b allow a number of IF frequencies to be used
- c remove image signals from the receiver
- d produce an audio frequency for the speaker

```
36-0
```

The gain used in the RF amplifier stage of a receiver should be:

- a as much as possible, short of self-oscillation
- b determined by the amplification factor of the first IF stage
- c sufficient to allow weak signals to overcome noise generated in the first mixer stage
- d sufficient to keep weak signals below the noise of the first mixer stage

37-7

In a CW transmitter, the output from this is connected to the driver/buffer:

- a power amplifier
- b master oscillator
- c telegraph key
- d power supply

38-1

In a CW transmitter, this is located between the driver/buffer stage and the antenna:

- a power supply
- b power amplifier
- c telegraph key
- d master oscillator

39 - 5

Several stations advise that your FM simplex transmission in the "two metre" band is distorted. The cause might be that:

- a the transmitter modulation deviation is too high
- b your antenna is too low
- c the transmitter has become unsynchronised
- d your transmitter frequency split is incorrect

40-7

Harmonic frequencies are:

- a at multiples of the fundamental frequency
- b always lower in frequency than the fundamental frequency
- c any unwanted frequency above the fundamental frequency
- d any frequency causing TVI

41-5

Parasitic oscillations in a RF power amplifier can be suppressed by:

- a $\,\,$ placing suitable chokes, ferrite beads or resistors within the amplifier
- b pulsing the supply voltage
- c screening all input leads
- d using split-stator tuning capacitors

42-1

The following unit in a DC power supply performs a rectifying operation:

- a an electrolytic capacitor
- b a full-wave diode bridge
- c a fuse
- d a crowbar

43-4 The regulator device in a power supply could consist of: four silicon power diodes in a regulator configuration two silicon power diodes and a centre-tapped transformer a single silicon power diode connected as a half-wave rectifier a three-terminal regulator chip 44-0 The correct order for callsigns in a callsign exchange at the start and end of a transmission is: a your callsign followed by the other callsign your own callsign, repeated twice the other callsign followed by your own callsign the other callsign, repeated twice 45-6 You are adjusting an antenna matching unit using an SWR bridge. You should adjust for: maximum reflected power b equal reflected and transmitted power c minimum reflected power d minimum transmitted power 46-2 "VOX" stands for: a volume operated extension speaker b voice operated transmit c variable oscillator transmitter d voice operated expander 47-7 The "Q" signal "your signals are fading" is: QSB oso b c QSL d QRX 48-7 An RF transmission line should be matched at the transmitter end to: prevent frequency drift transfer maximum power to the antenna overcome fading of the transmitted signal

- ensure that the radiated signal has the intended polarisation

49-3

A quarter-wave length of 50 ohm coaxial line is shorted at one end. The impedance seen at the other end of the line is:

- infinite а
- b zero
- 50 ohm С
- 150 ohm

A centre-fed dipole antenna for HF working can be made to operate on several bands, if the following item is installed at points in each leg:

- a a capacitor
- b an inductor
- c a fuse
- d a parallel-tuned trap

51-4

The impedance at the feed point of a folded dipole antenna is approximately:

- a 150 ohm
- b 200 ohm
- c 300 ohm
- d 100 ohm

52-6

A half-wave antenna is often called a:

- a bi-polar
- b Yagi
- c dipole
- d beam

53-3

A Yagi antenna is said to have a power gain over a dipole antenna for the same frequency band because:

- a it concentrates the radiation in one direction
- b it radiates more power than a dipole
- c more powerful transmitters can use it
- d it can be used for more than one band

54-0

A "skip zone" is:

- a $\,$ the distance between the antenna and where the refracted wave first returns to earth
- b the distance between any two refracted waves
- c a zone caused by lost sky waves
- d the distance between the far end of the ground wave and where the refracted wave first returns to earth

55-8

VHF and UHF bands are frequently used for satellite communication because:

- a $\,$ the Doppler frequency change caused by satellite motion is much less than at HF
- b satellites move too fast for HF waves to follow
- c waves at these frequencies travel to and from the satellite relatively unaffected by the ionosphere
- d the Doppler effect would cause HF waves to be shifted into the VHF and UHF bands

56-8

- A "line of sight" transmission between two stations uses mainly the:
- a ionosphere
- b troposphere
- c sky wave
- d ground wave

Which of the following is most likely to cause broad-band continuous interference:

- a poor commutation in an electric motor
- b an electric blanket switch
- c a refrigerator thermostat
- d a microwave transmitter

58-4

To reduce energy from an HF transmitter getting into a television receiver, the following could be placed in the TV antenna lead, as close to the TV as possible:

- a active filter
- b low-pass filter
- c band reject filter
- d high-pass filter

59-9

A filter used to attenuate a very narrow band of frequencies centred on 3.6 MHz would be called:

- a a band-pass filter
- b a notch filter
- c a high-pass filter
- d a low-pass filter

60-3

The following are three digital communication modes:

- a DSBSC, PACTOR, NBFM
- b AMTOR, PACTOR, PSK31
- c AGC, FSK, Clover
- d PSK31, AFC, PSSN
