01-4-(c)

The world is divided into radio regulatory regions, each with different radio spectrum allocations. New Zealand is in:

- a Region 1
- b Region 2
- c Region 3
- d Region 4

02-3-(b)

An Amateur Station is a station that is:

- a used primarily for emergency communications
- b operated by the holder of a General Amateur Operator Certificate of Competency on the amateur radio bands
- c owned and operated by a non-professional person
- d used exclusively to support communications for sporting organisations

03-4-(c)

- A logbook for recording information about stations worked:
- a is compulsory for every amateur radio operator
- b must list all messages sent
- c is recommended for all amateur radio operators
- d must record time in UTC

04 - 0 - (d)

You must surrender your General Amateur Operator Certificate of Competency at the age of:

- a 65 years
- b 70 years
- c 75 years
- d there is no age limit

05-3-(a)

A printed copy of your General Amateur Operator Certificate of Competency can be replaced by:

- a $\,$ downloading and printing yours from the official database (or have an Approved Radio Examiner do this for you)
- b download an application form from the MBIE website then, complete and submit it by post
- c phone the MBIE, give your callsign and request one by post
- d report your need to the nearest Approved Radio Examiner

06-0-(d)

The expression "amateur third party communications" refers to:

- a three operators in a sequential contact
- b the legal transmission of encrypted messages
- c amateur operators passing messages for remuneration
- d messages to or on behalf of non-licensed people or organisations

07-6-(d)

The abbreviation "VHF" refers to radio spectrum between:

- a 30 kHz and 300 kHz
- b 300 kHz and 3 MHz
- c 3 MHz and 30 MHz
- d 30 MHz and 300 MHz

```
08-7-(b)
In New Zealand, the "2 metre band" frequency limits are:
   144 to 149 MHz
b
  144 to 148 MHz
c 146 to 148 MHz
d 144 to 150 MHz
09-7-(a)
The following band is an exclusive primary allocation for New Zealand
amateur radio operators:
a 21 to 21.45 MHz
b 10.1 to 10.15 MHz
c 146 to 148 MHz
d 3.5 to 3.9 MHz
10-4-(d)
An electric current passes through a wire and produces around the wire:
а
  nothing
b an electric field
c an electrostatic field
d a magnetic field
11-7-(a)
Four good electrical insulators are:
  glass, air, plastic, porcelain
b plastic, rubber, wood, carbon
c glass, wood, copper, porcelain
   paper, glass, air, aluminium
12-9-(a)
The unit of resistance is the:
   ohm
   farad
b
  watt
С
d resistor
13-0-(c)
The voltage across a resistor carrying current can be calculated using
the formula:
a E = I + R [voltage equals current plus resistance]
  E = I - R [voltage equals current minus resistance]
   E = I x R [voltage equals current times resistance]
   E = I / R [voltage equals current divided by resistance]
14-7-(b)
The ohm is the unit of:
a supply voltage
  electrical resistance
   electrical pressure
d current flow
15-9-(b)
A dry cell has an open circuit voltage of 1.5 volt. When supplying a
large current, the voltage drops to 1.2 volt. This is due to the cell's:
  voltage capacity
b internal resistance
   electrolyte becoming dry
C
d current capacity
```

```
16-7-(b)
The total resistance of four 68 ohm resistors wired in parallel is:
  17 ohm
С
   34 ohm
  272 ohm
17-1-(b)
Two resistors are in parallel. Resistor A carries twice the current of
resistor B, which means that:
a B has half the resistance of A
  A has half the resistance of B
    the voltage across A is twice that across B
    the voltage across B is twice that across B
18-4-(d)
The current in a 100 kilohm resistor is 10 mA. The power dissipated is:
a
   1 watt
b 100 watt
c 10,000 watt
d 10 watt
19-5-(d)
Three 18 ohm resistors are connected in parallel across a 12 volt supply.
The total power dissipation of the resistor load is:
   3 watt
b 18 watt
c 36 watt
d 24 watt
20-6-(b)
One megahertz is equal to:
    0.0001 Hz
a
b
   1000 kHz
c 100 kHz
d 10 Hz
21-8-(b)
The reactance of an inductor increases as the:
    frequency decreases
    frequency increases
    applied voltage increases
    applied voltage decreases
22-1-(c)
Two 20 uH inductances are connected in series. The total inductance is:
   10 uH
   20 uH
b
   40 uH
C
   80 uH
```

```
23-4-(b)
An earth wire should be connected to the metal chassis of a mains-
operated power supply, to ensure that if a fault develops, the chassis:
    does not develop a high voltage with respect to the phase lead
    does not develop a high voltage with respect to earth
   becomes a conductor to bleed away static charge
    provides a path to ground in case of lightning strikes
The type of rectifier diode found most often in power supplies is:
a lithium
b silicon
С
   germanium
d copper oxide
25-8-(b)
The two basic types of field effect transistors are:
  NPN and PNP
b n-channel and p-channel
c germanium and silicon
    inductive and capacitive
26-7-(b)
The electrode that is usually a cylinder of wire mesh in a thermionic
valve is the:
a filament (heater)
b grid
c cathode
d anode
27-4-(a)
When measuring the current drawn by a light bulb from a DC supply, the
meter will act in circuit as:
   a low value resistance
b an insulator
c a perfect conductor
d an extra current drain
An amplifier has a gain of 40 dB. Assuming the same impedances, the ratio
of the rms output voltage to the rms input voltage is:
b
    20
    40
С
d
    400
In your HF station, this is the most useful for determining the
effectiveness of the antenna system:
    SWR bridge
a
b
  antenna switch
c linear amplifier
d
    dummy load
```

```
30-1-(b)
```

In a frequency modulation receiver, this is in between the antenna and the mixer:

- a the audio frequency amplifier
- b the radio frequency amplifier
- c the high frequency oscillator
- d the intermediate frequency amplifier

31-8-(d)

In a single sideband and CW receiver, this is connected to the output of the product detector:

- a the intermediate frequency amplifier
- b the high frequency oscillator
- the radio frequency amplifier
- d the audio frequency amplifier

32-5-(b)

The ability of a receiver to separate signals close in frequency is called its:

- a noise figure
- b selectivity
- c sensitivity
- d bandwidth

33-6-(c)

A 7 MHz signal and a 16 MHz oscillator are applied to a mixer stage. The output will contain the input frequencies and:

- a 8 and 9 MHz
- b 7 and 9 MHz
- c 9 and 23 MHz
- d 3.5 and 9 MHz

34-9-(b)

A receiver squelch circuit:

- a automatically keeps the audio output at maximum level
- b silences the receiver speaker during periods of no received signal
- c provides a noisy operating environment
- d is not suitable for pocket-size receivers

35-0-(d)

A communications receiver provides a choice of four IF bandpass filters installed in it, one at 250 Hz, one at 500 Hz, one at 2.4 kHz, and one at 6 kHz. If you were listening to a single sideband transmission, you would use:

- a 250 Hz
- b 6 kHz
- c 500 Hz
- d 2.4 kHz

36-2-(d)

The primary source of noise that can be heard in a UHF band receiver with its antenna connected is:

- a detector noise
- b atmospheric noise
- c man-made noise
- d receiver front-end noise

```
37-5-(a)
In an elementary frequency modulation transmitter, this is located
between the frequency multiplier and the antenna:
   power amplifier
b modulator
c speech amplifier
d oscillator
38-7-(a)
In a single sideband transmitter, the output of the variable frequency
oscillator is connected to the:
  mixer
  antenna
c balanced modulator
d linear amplifier
39-7-(b)
The process of modulation allows:
    information to be removed from a carrier
   information to be impressed on to a carrier
c voice and Morse code to be combined
d none of these
40-5-(b)
Harmonics produced in an early stage of a transmitter may be reduced in a
later stage by:
    increasing the signal input to the final stage
b using tuned circuit coupling between stages
    using FET power amplifiers
   using larger value coupling capacitors
41-0-(d)
Harmonics are to be avoided because they:
    cause damage to amateur equipment
   make your signal unreadable at other stations on that band
b
c cause possible interference to other users of that band
    cause possible interference to services using other bands
The capacitor value best suited for filtering the output of a 12 volt 1
amp DC power supply is:
    100 pF
b 10,000 uF
c 10 nF
d 100 nF
43-4-(d)
The regulator device in a power supply could consist of:
    four silicon power diodes in a regulator configuration
   two silicon power diodes and a centre-tapped transformer
c a single silicon power diode connected as a half-wave rectifier
d a three-terminal regulator chip
```

```
44-1-(b)
The following phonetic code is correct for the callsign "ZL2KMJ":
    zulu lima two kilowatt mac jamboree
    zulu lima two kilo mike juliet
c zanzibar london two kilo mike japan
    zulu lima two kilowatt montreal japan
45-2-(c)
"Break-in keying" means:
a unauthorised entry has resulted in station equipment disappearing
b temporary emergency operating
   key-down changes the station to transmit, key-up to receive
    the other station's keying is erratic
46-4-(c)
The "RIT" control on a transceiver:
    reduces interference on the transmission
   changes the frequency of the transmitter section without affecting
the frequency of the receiver section
c changes the frequency of the receiver section without affecting the
frequency of the transmitter section
   changes the transmitting and receiver frequencies by the same amount
47-8-(c)
The signal "QSY?" means:
a shall I relay to .... ?
b shall I increase transmitter power?
    shall I transmit on another frequency?
   is my signal fading?
48-8-(d)
A damaged antenna or feedline attached to the output of a transmitter
will present an incorrect load resulting in:
    the driver stage not delivering power to the final
    the output tuned circuit breaking down
b
   loss of modulation in the transmitted signal
    excessive heating or protection shut-down in the transmitter output
stage
49-2-(d)
A result of standing waves on a non-resonant transmission line is:
  maximum transfer of energy to the antenna from the transmitter
b perfect impedance match between transmitter and feedline
c lack of radiation from the transmission line
d reduced transfer of RF energy to the antenna
50-2-(c)
The shortest "active" element of a Yagi antenna is the:
a boom
  reflector
b
c director(s)
d driven element
```

```
51-6-(d)
The effect of adding a series inductance to an antenna is to:
    increase the resonant frequency
  have no change on the resonant frequency
c have little effect
d decrease the resonant frequency
52-0-(d)
A radio wave with a frequency of 3.8 MHz has a wavelength of:
   78.94cm
   7894m
b
   789.4m
C
d 78.94m
53-7-(a)
The main reason why many VHF base and mobile antennas in amateur use are
5/8 of a wavelength long is that:
   most of the energy is radiated at a low angle
b it is easy to match the antenna to the transmitter
    it is a convenient length on VHF
    the angle of radiation is high giving excellent local coverage
54-0-(d)
A "skip zone" is:
    the distance between the antenna and where the refracted wave first
returns to earth
   the distance between any two refracted waves
    a zone caused by lost sky waves
    the distance between the far end of the ground wave and where the
refracted wave first returns to earth
55-7-(a)
A variation in received signal strength caused by slowly changing
differences in path lengths is called:
   fading
а
b absorption
c fluctuation
d path loss
56-1-(a)
The MUF for a given radio path is the:
  maximum usable frequency
b mean of the maximum and minimum usable frequencies
c minimum usable frequency
d mandatory usable frequency
57-8-(c)
When someone in the neighbourhood complains of TVI, it is wise to:
    deny all responsibility
    immediately blame the other equipment
b
c check your log to see if it coincides with your transmissions
    inform all the other neighbours
```

```
58-9-(a)
Installing a low-pass filter between the transmitter and transmission
line will:
   permit lower frequency signals to pass to the antenna
b permit higher frequency signals to pass to the antenna
   ensure an SWR not exceeding 2:1
d reduce the power output back to the legal maximum
59-4-(c)
A high-pass filter attenuates:
   a band of frequencies in the VHF region
    all except a band of VHF frequencies
    low frequencies but not high frequencies
   high frequencies but not low frequencies
60-8-(d)
"ITA2" is:
  Morse code sent such that the baud speed is equal to the dot speed
b a coding system identifying modulation types
c an error correction code
d a 5 bit alphabet used for digital communications
```
