An Amateur Station is quoted in the regulations as a station:

- a for training new radio operators
- b using amateur equipment for commercial purposes
- c for public emergency purposes
- d in the Amateur Service

02-6

Unidentified signals may be transmitted by an amateur station:

- a when making brief tests not intended to be received
- b when security of message content is required
- c never, such transmissions are not permitted
- d on any frequency clear of interference

03-9

If your signal is strong and perfectly readable at a distant station, you should:

- a reduce your SWR
- b reduce your transmitter power output to the minimum needed to maintain contact
- c not change anything or you may lose contact
- d switch on your speech processor

04 - 5

This callsign could be that allocated to a New Zealand amateur radio operator:

- a ZL2KMJ
- b ZK-CFK
- c ZM4432
- d ZLGA

05-6

A General Amateur Operator Certificate of Competency is usually issued for:

- a two years
- b five years
- c ten years
- d life

06-6

If interference to the reception of radiocommunications is caused by the operation of an amateur station, the station operator:

- a may continue to operate
- b need not take any action
- c must immediately comply with any action required by the MBIE to prevent the interference
- d may continue and fix the problem when finances permit

07-8

An amateur station may be shut down at any time by:

- a a neighbour with a gripe about your aerial system
- b a neighbour with an old and damaged television aerial
- c a demand from an authorised official of the Ministry of Business, Innovation & Employment
- d a neighbour with a gripe about interference on his old model television receiver

```
08-5
In New Zealand, the "15 metre band" frequency limits are:
  21.00 to 21.45 MHz
  21.00 to 21.40 MHz
   21.00 to 21.35 MHz
   21.00 to 21.30 MHz
09-1
Amateur satellites may operate on these two bands:
a 21.0 to 21.1 MHz and 146.0 to 148.0 MHz
b 28.0 to 29.7 MHz and 144.0 to 146.0 MHz
   3.5 to 3.8 MHz and 7.0 to 7.1 MHz
   7.1 to 7.3 MHz and 10.1 to 10.15 MHz
10-6
This material is better for making permanent magnets:
  copper
  aluminium
b
  steel
С
   soft iron
d
11-9
The name for the flow of electrons in an electric circuit is:
a voltage
b current
c resistance
d capacitance
12-0
The unit of impedance is the:
   farad
b
  ampere
c henry
d
   ohm
The voltage to cause a current of 4.4 ampere to flow in a 50 ohm
resistance is:
   2220 volt
  22.0 volt
b
c 220 volt
d
   0.222 volt
14-7
The ohm is the unit of:
   supply voltage
  electrical resistance
b
  electrical pressure
d current flow
```

```
15-1
Two resistors are connected in parallel and are connected across a 40
volt battery. If each resistor is 1000 ohms, the total battery current
is:
    40 ampere
b
    80 milliampere
    40 milliampere
C
d
    80 ampere
16-0
A 6 ohm resistor is connected in parallel with a 30 ohm resistor. The
total resistance of the combination is:
    8 ohm
    24 ohm
   35 ohm
    5 ohm
17-9
Three 500 ohm resistors are wired in series. Short-circuiting the centre
resistor will change the value of the network from:
    500 ohm to 1000 ohm
    1500 ohm to 1000 ohm
    1000 ohm to 500 ohm
    1000 ohm to 1500 ohm
18-4
The current in a 100 kilohm resistor is 10 mA. The power dissipated is:
   1 watt
   100 watt
    10,000 watt
d
   10 watt
The power dissipation of a resistor carrying a current of 10 mA with 10
volt across it is:
    0.01 watt
   1 watt
b
   10 watt
C
   0.1 watt
A sinewave alternating current of 10 ampere peak has an rms value of:
a 5 amp
    14.14 amp
    7.07 amp
   20 amp
d
A radio component in a circuit diagram is identified as a capacitor, if
its value is measured in:
a
   microfarads
b microvolts
```

c millihenrys
d megohms

```
22-8
An inductor and a capacitor form a resonant circuit. If the value of the
inductor is decreased by a factor of four, the resonant frequency will:
   increase by a factor of two
   increase by a factor of four
   decrease by a factor of two
   decrease by a factor of four
23-6
The correct colour coding for the phase wire in a flexible mains lead is:
  brown
b
  blue
  yellow and green
   white
24-0
The basic semiconductor amplifying device is a:
   transistor
b PN-junction
c diode
d silicon gate
25-8
The two basic types of field effect transistors are:
a NPN and PNP
b n-channel and p-channel
c germanium and silicon
d inductive and capacitive
26-5
A feature common to thermionic valves and transistors is that both:
  can amplify signals
b have electrons drifting through a vacuum
c convert electrical energy to radio waves
d use heat to cause electron movement
A good ammeter should have:
  a very high internal resistance
  a resistance equal to that of all other components in the circuit
c an infinite resistance
d a very low internal resistance
```

An attenuator network comprises two 100 ohm resistors in series, with the input applied across both resistors and the output taken from across one of them. The attenuation of the network is:

- a 0.707
- b 0.5
- c 0.35
- d 0.25

```
29-0
In designing an HF station, you would use this to reduce the effects of
harmonic radiation:
   dummy load
b
   antenna switch
C
   SWR bridge
  low pass filter
30-5
In a frequency modulation receiver, this is located between the filter
and the limiter:
    the high frequency oscillator
    the intermediate frequency amplifier
b
    the mixer
    the radio frequency amplifier
31-7
In a single sideband and CW receiver, the output from this is connected
to the product detector:
    the mixer
    the beat frequency oscillator
h
    the radio frequency amplifier
    the audio frequency amplifier
32-8
To receive Morse code signals, a BFO is employed in a superhet receiver
а
   produce IF signals
  beat with the local oscillator signal to produce sidebands
   beat with the IF signal to produce an audio tone
   produce an audio tone to beat with the IF signal
33-4
The stage in a superhet receiver with a tuneable input and fixed tuned
output is the:
  RF amplifier
  IF amplifier
b
   local oscillator
d
  mixer stage
The tuning control of a superhet receiver changes the tuned frequency of
the:
   audio amplifier
а
  IF amplifier
b
  local oscillator
   post-detector amplifier
35-8
It is very important that the oscillators contained in a superhet
receiver are:
   sensitive and selective
```

b

stable and sensitive

c selective and spectrally pure
d stable and spectrally pure

The gain used in the RF amplifier stage of a receiver should be:

- a as much as possible, short of self-oscillation
- b determined by the amplification factor of the first IF stage
- c sufficient to allow weak signals to overcome noise generated in the first mixer stage
- d sufficient to keep weak signals below the noise of the first mixer stage

37-2

In a frequency modulation transmitter, this is located between the speech amplifier and the oscillator:

- a power amplifier
- b microphone
- c modulator
- d frequency multiplier

38-3

In a single sideband transmitter, the output of this is connected to a sideband-selecting filter:

- a balanced modulator
- b microphone
- c mixer
- d radio frequency oscillator

39-4

The purpose of a balanced modulator in a SSB transmitter is to:

- a make sure that the carrier and both sidebands are in phase
- b ensure that the percentage of modulation is kept constant
- $\ensuremath{\mathtt{c}}$ make sure that the carrier and both sidebands are 180 degrees out of phase
- d suppress the carrier while producing two sidebands

40-1

The third harmonic of 7 MHz is:

- a 10 MHz
- b 21 MHz
- c 14 MHz
- d 28 MHz

41-3

A spurious transmission from a transmitter is:

- a an unwanted emission that is harmonically related to the modulating audio frequency
- b an unwanted emission unrelated to the output signal frequency
- c generated at 50 Hz
- d the main part of the modulated carrier

42-9

Electrolytic capacitors are used in power supplies because:

- a they are tuned to operate at 50 Hz
- b they can be obtained in larger values than other types
- c they have very low losses compared to other types
- d they radiate less RF noise than other types

```
43-7
In a regulated power supply, the "crowbar" is a:
   means to lever up the output voltage
  last-ditch protection against over-voltage resulting from failure of
the regulator in the supply
   convenient means to move such a heavy supply unit
    circuit for testing mains fuses
44-7
When conversing via a VHF or UHF repeater, you should pause between overs
for about:
   3 seconds
  half a second
h
   30 seconds
    several minutes
45-8
The "S meter" on a receiver:
    indicates where the squelch control should be set
    indicates the standing wave ratio
    indicates the state of the battery voltage
    indicates relative incoming signal strengths
A noise blanker on a receiver is most effective to reduce:
a 50 Hz power supply hum
   noise originating from the mixer stage of the receiver
C
    ignition noise
d
   noise originating from the RF stage of the receiver
47-6
The "Q" signal "shall I decrease transmitter power?" is:
   QRL?
а
b
    QRZ?
C
    ORN?
d
    ORP?
48 - 4
The designed output impedance of the antenna socket of most modern
transmitters is nominally:
  25 ohm
а
b 75 ohm
c 100 ohm
d 50 ohm
49-0
Losses occurring on a transmission line between a transmitter and the
antenna result in:
   a SWR of 1:1
а
b reflections occurring in the line
c less RF power being radiated
    improved transfer of RF energy to the antenna
```

```
50-1
The longest "active" element of a Yagi antenna is the:
   reflector
  boom
   driven element
   director(s)
51-7
The purpose of a balun in a transmitting antenna system is to:
a match unbalanced and balanced transmission lines
b balance harmonic radiation
c reduce unbalanced standing waves
   protect the antenna system from lightning strikes
52-7
The resonant frequency of a dipole antenna is mainly determined by:
    its height above the ground
    its length
    the output power of the transmitter used
С
    the length of the transmission line
53-5
The reflector and director(s) in a Yagi antenna are called:
a oscillators
b parasitic elements
c tuning stubs
d matching units
54-5
That portion of HF radiation which is directly affected by the surface of
the earth is called:
   ground wave
   local field wave
b
c inverted wave
d ionospheric wave
VHF and UHF bands are frequently used for satellite communication
because:
   the Doppler frequency change caused by satellite motion is much less
than at HF
  satellites move too fast for HF waves to follow
   waves at these frequencies travel to and from the satellite
relatively unaffected by the ionosphere
    the Doppler effect would cause HF waves to be shifted into the VHF
and UHF bands
Regular changes in the ionosphere occur approximately every 11:
a
  years
b days
c months
d centuries
```

When someone in the neighbourhood complains of TVI, it is wise to:

- a deny all responsibility
- b immediately blame the other equipment
- c check your log to see if it coincides with your transmissions
- d inform all the other neighbours

58-2

Unwanted signals from a radio transmitter which cause harmful interference to other users are known as:

- a rectified signals
- b re-radiation signals
- c harmonic and other spurious signals
- d reflected signals

50-1

Television interference caused by harmonics radiated from an amateur transmitter could be eliminated by fitting:

- a a low-pass filter in the TV receiver antenna input
- b a low-pass filter in the transmitter output
- c a high-pass filter in the transmitter output
- d a band-pass filter to the speech amplifier

60-2

The following can be adapted for use as a modem:

- a an electronic keyer
- b a spare transceiver
- c a computer sound-card
- d a spare receiver
