01-0 A brief definition for the Amateur Service is: a private radio service intended only for emergency communications а a public radio service used for public service communications b a radiocommunication service for the purpose of self-training, С intercommunication and technical investigation d a radio service for personal gain and public benefit 02-1 As the holder of a General Amateur Operator Certificate of Competency, you may operate transmitters in your station: any number at one time а b only one at any time except in emergencies one at a time С d any number but must be on different bands 03-0 An amateur radio operator must have current mail and e-mail addresses, so the Ministry of Business, Innovation & Employment: has a record of the location of every amateur station a b can reimburse your station expenses c can send mail to the operator d can publish a callsign directory 04-0 You must surrender your General Amateur Operator Certificate of Competency at the age of: a 65 years b 70 years С 75 years d there is no age limit 05-8 A General Amateur Operator Certificate of Competency holder may permit any other person to: take part in amateur radio communication а operate that operator's home station b c pass brief messages of a personal nature, provided no fees or other consideration are requested or accepted d to work on radio repairs under their supervision 06-7 Amateur radio operators may knowingly interfere with other radio communications or signals: a when tuning up a transmitting system b never c when another station already occupies your proposed transmitting frequency if resulting interference is going to be inevitable d

07 - 1A New Zealand amateur radio operator may: be prepared with emergency radio apparatus available on 12-hour а notice b train for and support disaster relief activities С operate with emergency traffic-handling, using solar cells during week-end days d use portable antennas but, only during daylight hours 08-4 In New Zealand, the "20 metre band" frequency limits are: 14.00 to 14.20 MHz а 14.00 to 14.25 MHz b 14.00 to 14.30 MHz С d 14.00 to 14.35 MHz 09-8 When the Amateur Service is a secondary user of a band and another service is the primary user, this means: nothing at all, because all services have equal rights to operate а amateurs may only use the band during declared emergencies b the band may be used by amateurs provided harmful interference is not С caused to other services you may increase transmitter power to overcome any interference d 10-1 Silicon, as used in diodes and transistors, has been doped to become: а a semiconductor b a superconductor a conductor С d an insulator 11-0 The plastic coating around wire is: a a conductor b an inductor c an insulator d a magnet 12-5 The voltage "two volts" is also: a 2,000 mV b 2,000 kV c 2,000 uV d 2,000 MV 13-1 A current of 10 mA is measured in a 500 ohm resistor. The voltage across the resistor will be: a 50 volt b 5 volt c 500 volt d 5000 volt

14 - 1A circuit has a total resistance of 100 ohm and 50 volt is applied across it. The current flow will be: 500 mA а 50 mA b С 2 ampere d 20 ampere 15-4 You can operate this greatest number of identical lamps, each drawing a current of 250 mA, from a 5A supply: 50 а 30 b 20 С d 5 16-5 If a 2.2 megohm and a 100 kilohm resistor are connected in series, the total resistance is: 2.3 megohm а b 2.1 megohm 2.11 megohm С d 2.21 megohm 17 - 3The following combination of 28 ohm resistors has a total resistance of 42 ohm: а a combination of two resistors in parallel, then placed in series with another resistor a combination of two resistors in parallel, then placed in series b with another two in parallel С three resistors in series d three resistors in parallel 18 - 5A current of 500 milliamp passes through a 1000 ohm resistance. The power dissipated is: 250 watt а 0.25 watt b С 2.5 watt d 25 watt 19-0 The following two quantities should be multiplied together to find power: resistance and capacitance а voltage and inductance b voltage and current С inductance and capacitance d 20 - 4An impure signal is found to have 2 kHz and 4 kHz components. This 4 kHz signal is: a harmonic of the 2 kHz signal а a fundamental of the 2 kHz signal b a sub-harmonic of 2 kHz С the DC component of the main signal d

21-9 Increasing the number of turns on an inductor will make its inductance: а decrease remain unchanged b become resistive С d increase 22-6 An inductor and a capacitor are connected in parallel. At the resonant frequency, the resulting impedance is: minimum а h maximum totally reactive С totally inductive d 23-8 The correct colour coding for the earth wire in a flexible mains lead is: a brown b yellow and green c blue d white 24-9 The following material is considered to be a semiconductor: a copper b sulphur silicon С d tantalum 25-7 To bias a transistor to cut-off, the base must be: at the collector potential а mid-way between collector and emitter potentials b at the emitter potential С d mid-way between the collector and the supply potentials 26-9 A triode valve has this many grids: а one b two С three d three plus a filament 27-6 An ammeter should not be connected directly across the terminals of a 12 volt car battery because: no current will flow because no other components are in the circuit а the resulting high current will probably destroy the ammeter b the battery voltage will be too low for a measurable current to flow С

d the battery voltage will be too high for a measurable current to flow

28-5 An attenuator network has 10 volt rms applied to its input with 1 volt rms measured at its output. The attenuation of the network is: 6 dB а 10 dB b 40 dB С 20 dB d 29 - 4In an HF station, the "linear amplifier" is: an amplifier to remove distortion in signals from the transceiver a an amplifier with all components arranged in-line b a push-pull amplifier to cancel second harmonic distortion С d an optional amplifier to be switched in when higher power is required 30-9 In a frequency modulation receiver, this connects to the audio frequency amplifier output: a the intermediate frequency amplifier the speaker and/or headphones b the frequency discriminator С d the limiter 31-9 In a single sideband and CW receiver, this is connected to the output of the audio frequency amplifier: the speaker and/or headphones a b the mixer the radio frequency amplifier С d the beat frequency oscillator 32-2 Of two receivers, the one capable of receiving the weakest signal will have: an RF gain control а b the loudest audio output the greatest tuning range С the least internally generated noise d 33-9 The AGC circuit in a receiver usually controls the: a RF and IF stages b audio stage c mixer stage d power supply 34-1 A superhet receiver, with an IF at 500 kHz, is receiving a 14 MHz signal. The local oscillator frequency is: 19 MHz а 14.5 MHz b c 500 kHz 28 MHz d

35 - 1In a communications receiver, a highly-selective filter would be located in the: IF circuits а b local oscillator С audio output stage d detector 36-2 The primary source of noise that can be heard in a UHF band receiver with its antenna connected is: a detector noise b atmospheric noise c man-made noise d receiver front-end noise 37-9 In a CW transmitter, this is located between the master oscillator and the power amplifier: a driver/buffer b audio amplifier c power supply d telegraph key 38-8 In a single sideband transmitter, the output of this is connected to the mixer: a radio frequency oscillator b linear amplifier c variable frequency oscillator d antenna 39-5 Several stations advise that your FM simplex transmission in the "two metre" band is distorted. The cause might be that: the transmitter modulation deviation is too high а your antenna is too low b the transmitter has become unsynchronised С your transmitter frequency split is incorrect d 40 - 0A harmonic of a signal transmitted at 3525 kHz would be expected to occur at: 3573 kHz a b 21050 kHz 7050 kHz С d 14025 kHz 41-0 Harmonics are to be avoided because they: cause damage to amateur equipment a b make your signal unreadable at other stations on that band c cause possible interference to other users of that band d cause possible interference to services using other bands

42-3 The following could power a solid-state 10 watt VHF transceiver: a 12 volt car battery а 6 penlite cells in series b c a 12 volt, 500 mA plug-pack d a 6 volt 10 amp-hour gel cell 43-2 A transformer is used in a power supply to: transform the incoming mains AC voltage to a DC voltage а ensure that any RF radiation cannot get into the power supply b transform the mains AC voltage to a more convenient AC voltage С transform the mains AC waveform into a higher frequency waveform Ь 44-3 A signal report of "5 and 1" indicates: perfect intelligibility but very low signal strength а b very low intelligibility but good signal strength c perfect intelligibility, high signal strength d medium intelligibility and signal strength 45-9 The "National System" is: a series of nationwide amateur radio linked repeaters in the 70 cm а band b the legal licensing standard of Amateur operation in New Zealand the official New Zealand repeater band plan С a nationwide emergency communications procedure d 46-2 "VOX" stands for: volume operated extension speaker а voice operated transmit b variable oscillator transmitter С d voice operated expander 47-6 The "Q" signal "shall I decrease transmitter power?" is: QRL? а QRZ? b С QRN? d QRP? 48-0 Any length of transmission line may be made to appear as an infinitely long line by: shorting the line at the end а leaving the line open at the end b increasing the standing wave ratio above unity С terminating the line in its characteristic impedance d 49-7 The velocity factor of a coaxial cable with solid polythene dielectric is about: а 0.66 0.1 b 0.8 С d 1.0

50-0 The support member for the elements of a Yagi antenna is known as the: reflector а driven element b director С d boom 51-2 An antenna which transmits equally well in all compass directions is a: dipole with a reflector only a dipole with director only b С half-wave horizontal dipole d quarter-wave grounded vertical 52-9 A vertical antenna which uses a flat conductive surface at its base is the: quarter-wave ground plane а vertical dipole b c rhombic long wire d 53-9 On VHF and UHF bands, polarisation of the receiving antenna is important in relation to the transmitting antenna, but on HF it is relatively unimportant because: the ground wave and the sky wave continually shift the polarisation а the ionosphere can change the polarisation of the signal from moment b to moment anomalies in the earth's magnetic field profoundly affect HF С polarisation improved selectivity in HF receivers makes changes in polarisation d redundant 54-2 The highest frequency that will be reflected back to the earth at any given time is known as the: UHF а OWF b MUF С d LUF 55-6 The distance from the transmitter to the nearest point where the sky wave returns to the earth is called the: angle of radiation а maximum usable frequency b skip zone С skip distance d 56-3 Skip distance is a term associated with signals through the ionosphere. Skip effects are due to: selective fading of local signals а reflection and refraction from the ionosphere b С high gain antennas being used d local cloud cover

57-9 Cross-modulation is usually caused by: a key-clicks generated at the transmitter b rectification of strong signals in overloaded stages improper filtering in the transmitter С d lack of receiver sensitivity and selectivity 58-1 Cross-modulation of a broadcast receiver by a nearby transmitter would be noticed in the receiver as: the undesired signal in the background of the desired signal а a lack of signals being received b С interference only when a broadcast signal is received distortion on transmitted voice peaks d 59-7 The input impedance of an operational amplifier is generally: a very high b very low c capacitive d inductive 60-7 The letters BBS stand for: a binary baud system b bulletin board system c basic binary selector d broadcast band stopper
